Local observations of a small sample

1. Introduction

The first observation establishes the baseline. This sample preserves original paragraph order, a selectable inline equation E = m c^2, and the reference [1].

2. Results

The second observation introduces a raster figure. Figure 1 remains between its preceding and following paragraphs.

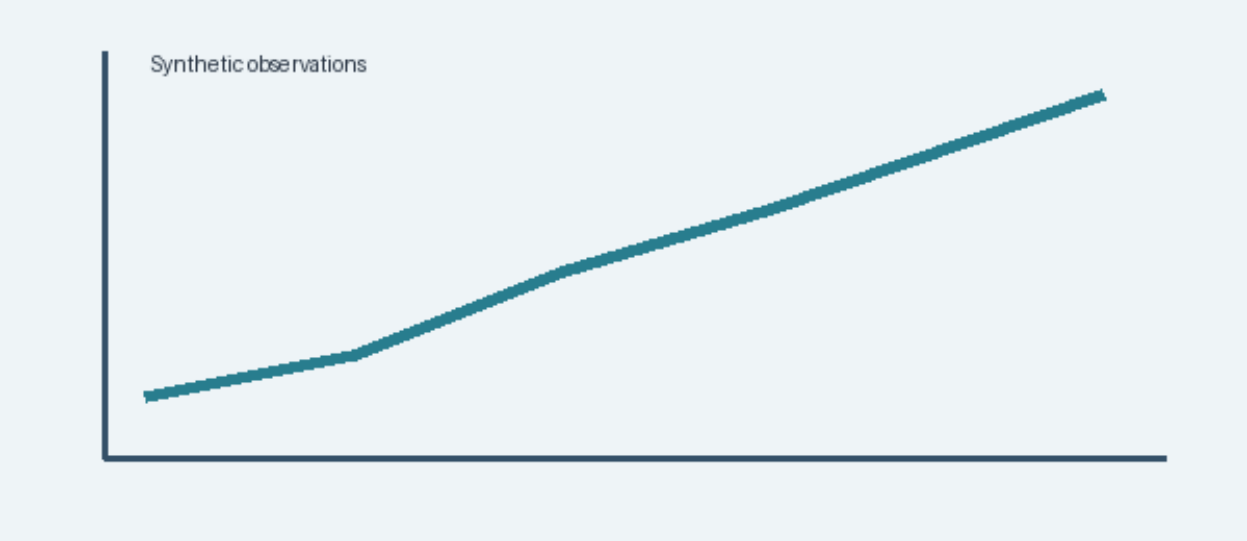

Figure 1. Synthetic measurements increase across five observations.

The third observation follows the figure. A paragraph continues at the page boundary: the measurement remains

stable after the page boundary, so its two segments must retain their sequence. The PDF does not encode a semantic join between these segments.

3. Table and equation

Sample	Value	Unit
A	12	ms
B	18	ms

Table 1. Measured values with ruled cells.

The block equation is selectable plain text:

$$y = \alpha * x + \beta \quad (1)$$
